Course Learning Outcomes

After the successful completion of the course, the student will be able to:

Course Learning Outcome	Description
CO 1	Formulate the mathematical models Using the effect of inductance and capacitance for interconnected electrical power networks.
CO 2	Evaluate the suitability of installing overhead and underground power transmission strategies considering electrical, mechanical, environmental, performance, safety and economic constraints.
CO 3	Explain in detail and critically evaluate technologies and information systems for the operational management of conventional and modern electric power systems.
CO 4	Implement the knowledge of basic mathematical, physical and electrical principles to formulate significant electrical hazards. Analyze the stability of a power transmission system by measuring appropriate parameters.
CO 5	Recognize the need to continuously follow the advancements in technology and incorporate them into the present system to improve efficiency. Choose the appropriate type of power transmission system following norms and guidelines related to cost, environment, societal and ethical issues.
